Ernesto RODRIGUEZ
NASA Jet Propulsion Laboratory

THALES

Recall of **altimeter** main product

- Waveforms
- Main difficulties on continental waters

A **new processing philosophy** over continental waters

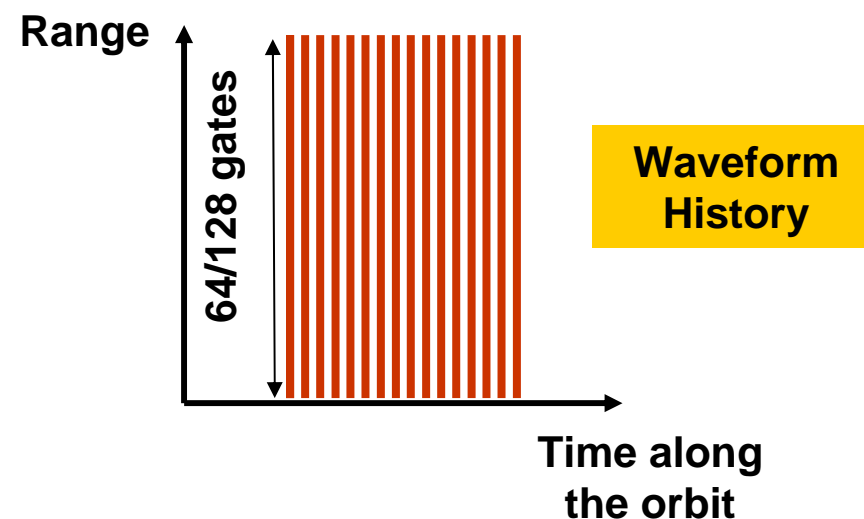

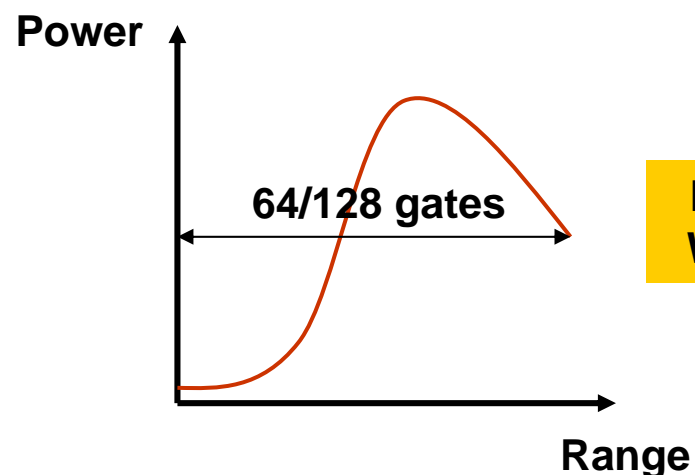

- Get out of the current ways of processing individual waveforms
- Preliminary development of a **retracking tool**
- Data necessary as entries

First applications over two rivers: Meuse and Lena

Conclusions and perspectives

Altimeter main product

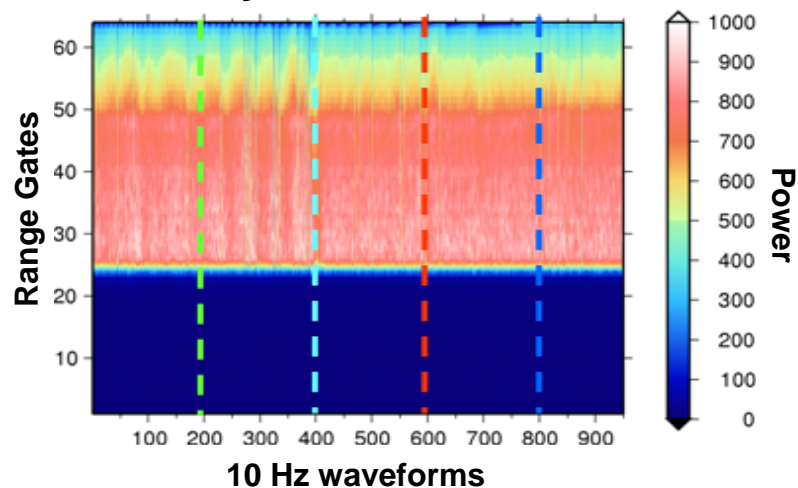

- Power with respect to distance: a **waveform**
- Waveform sampling related to the radar characteristics

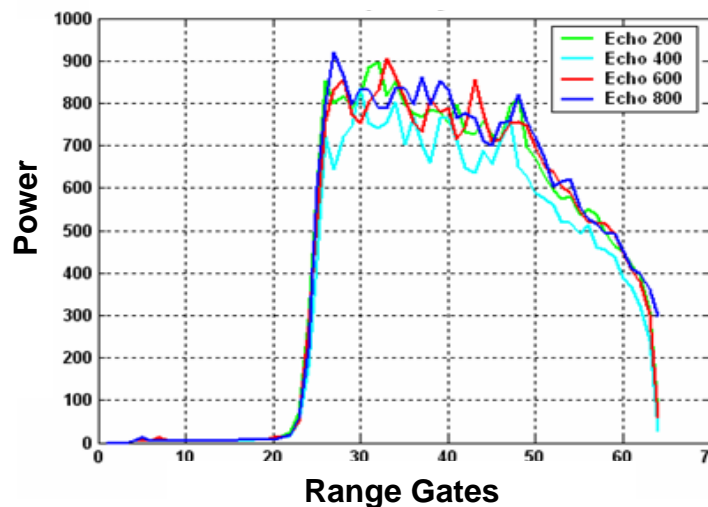

Analysis of the individual averaged waveform (50 ms - 1 s)

- Fitting to an analytical waveform model
- Estimation of surface parameters

T/P Cycle 430 track 058

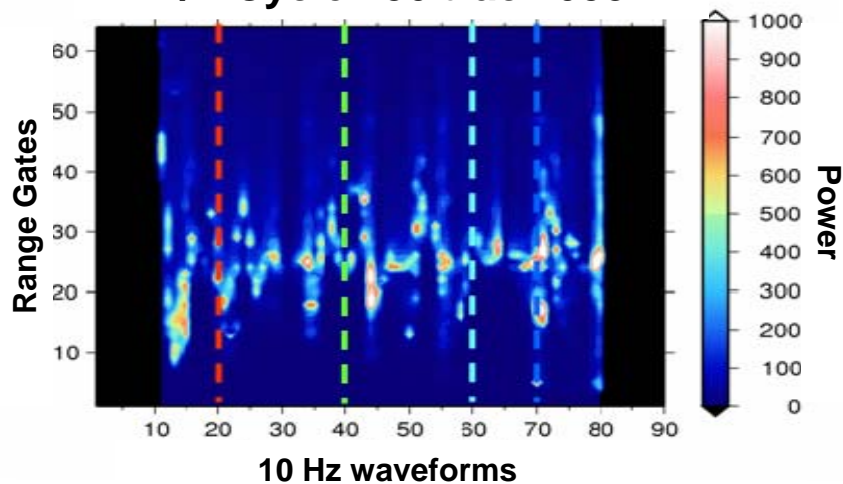

Sea waveforms

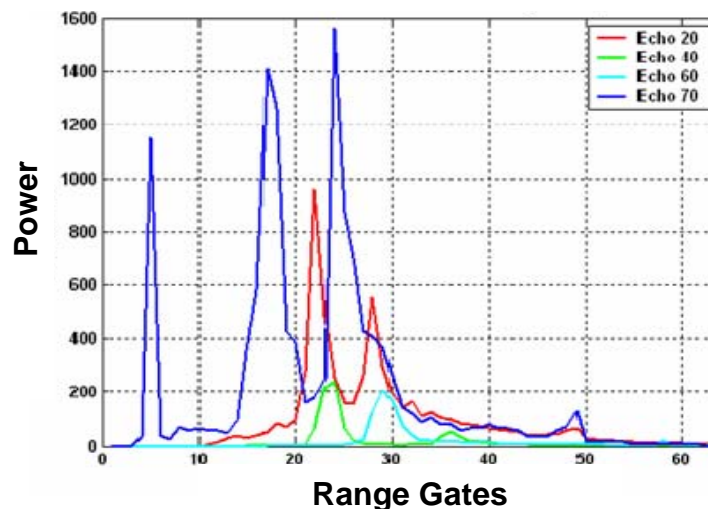

Ocean (Brown model)

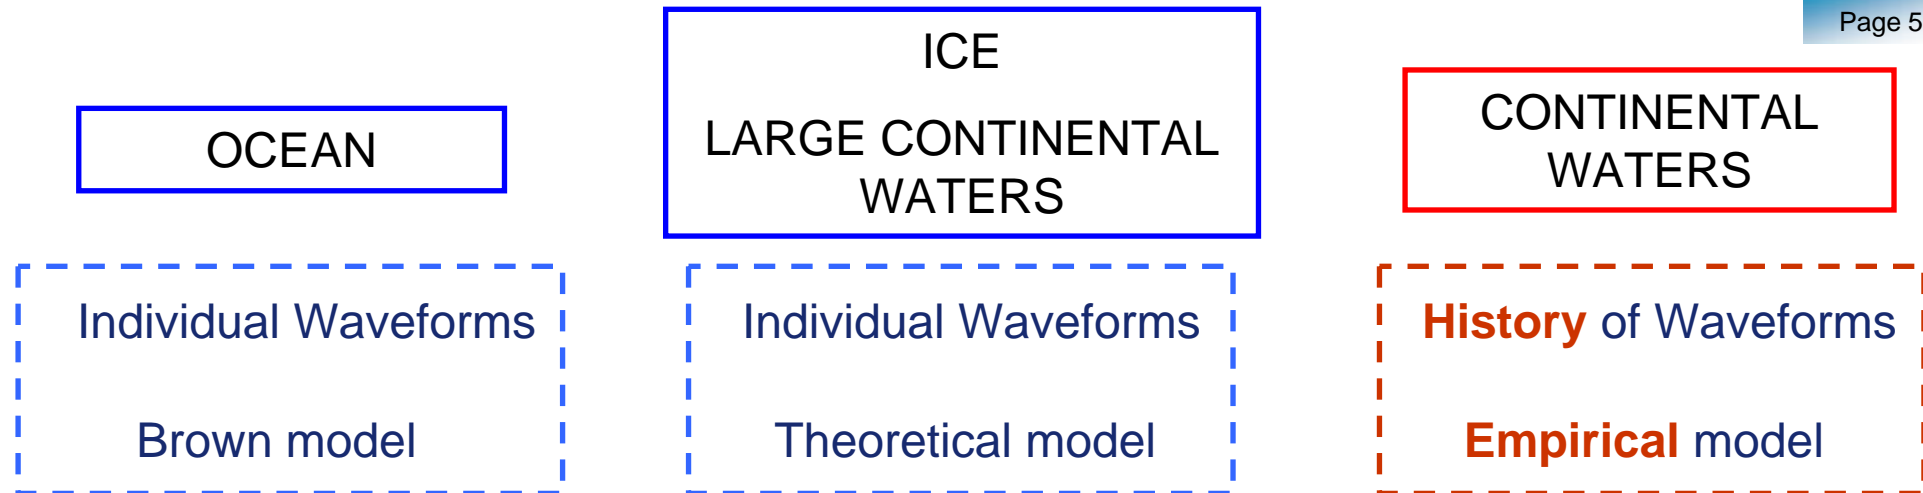

T/P Cycle 430 track 058

Continental waters waveforms

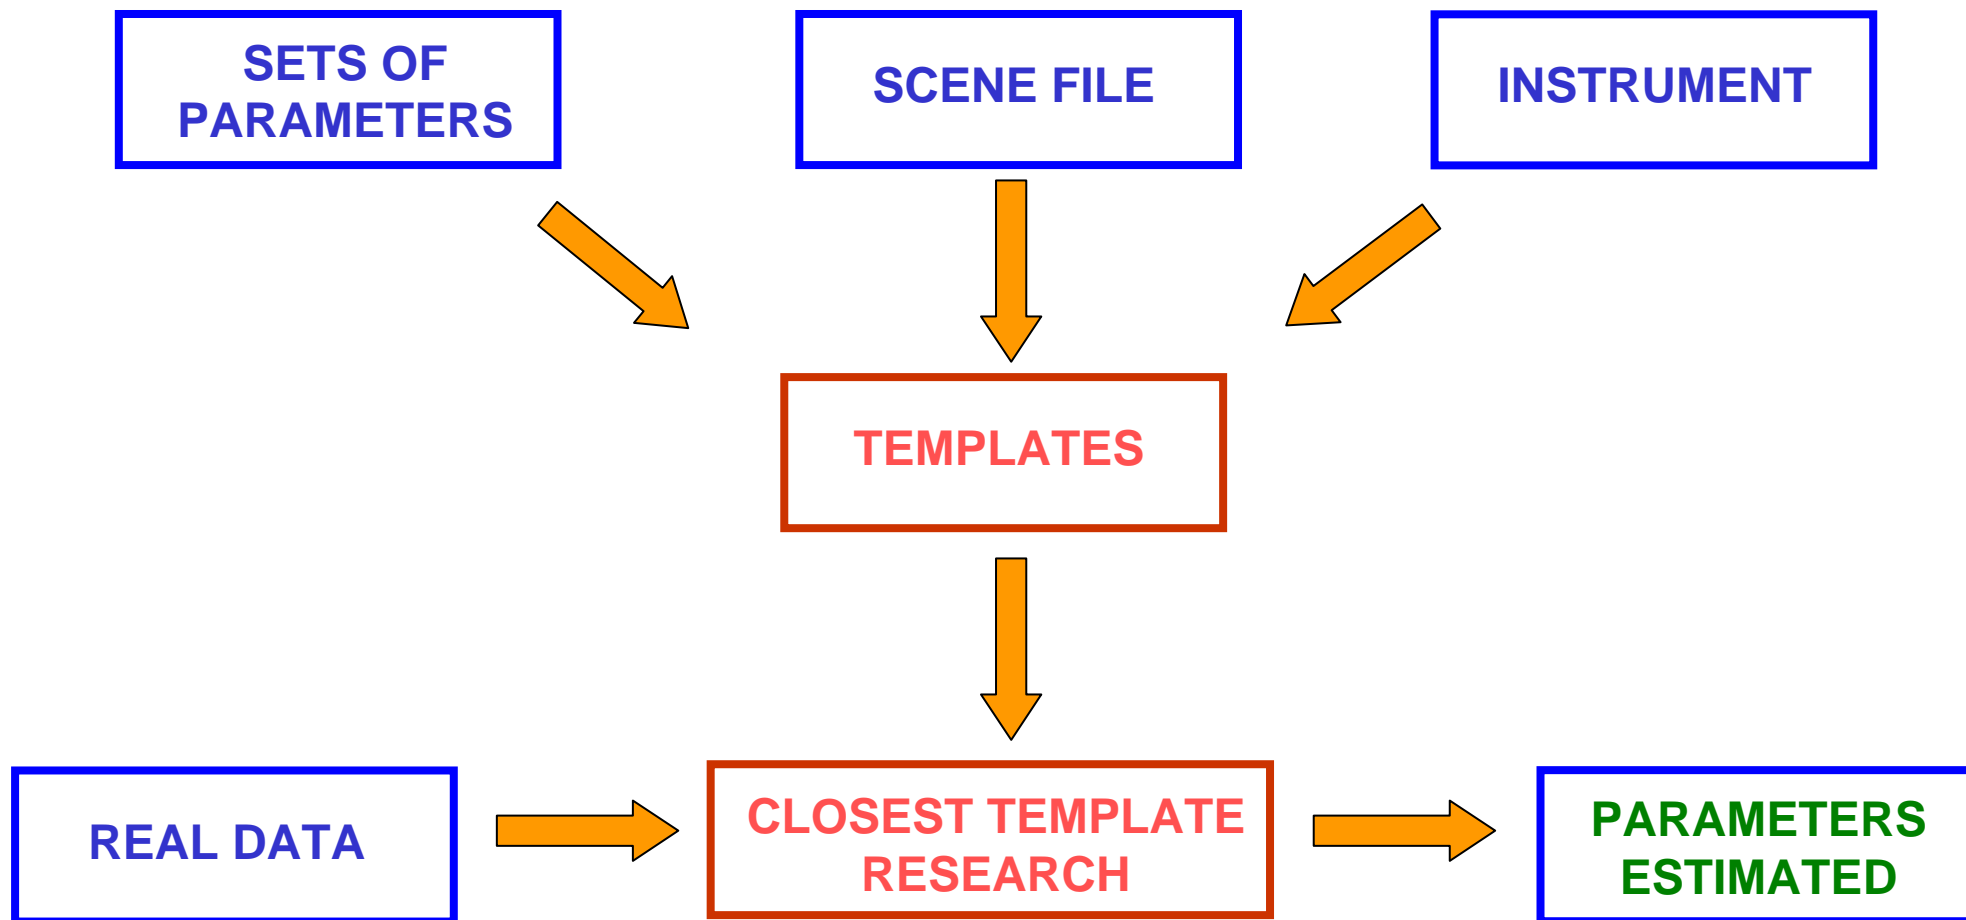

Continental waters (no model)

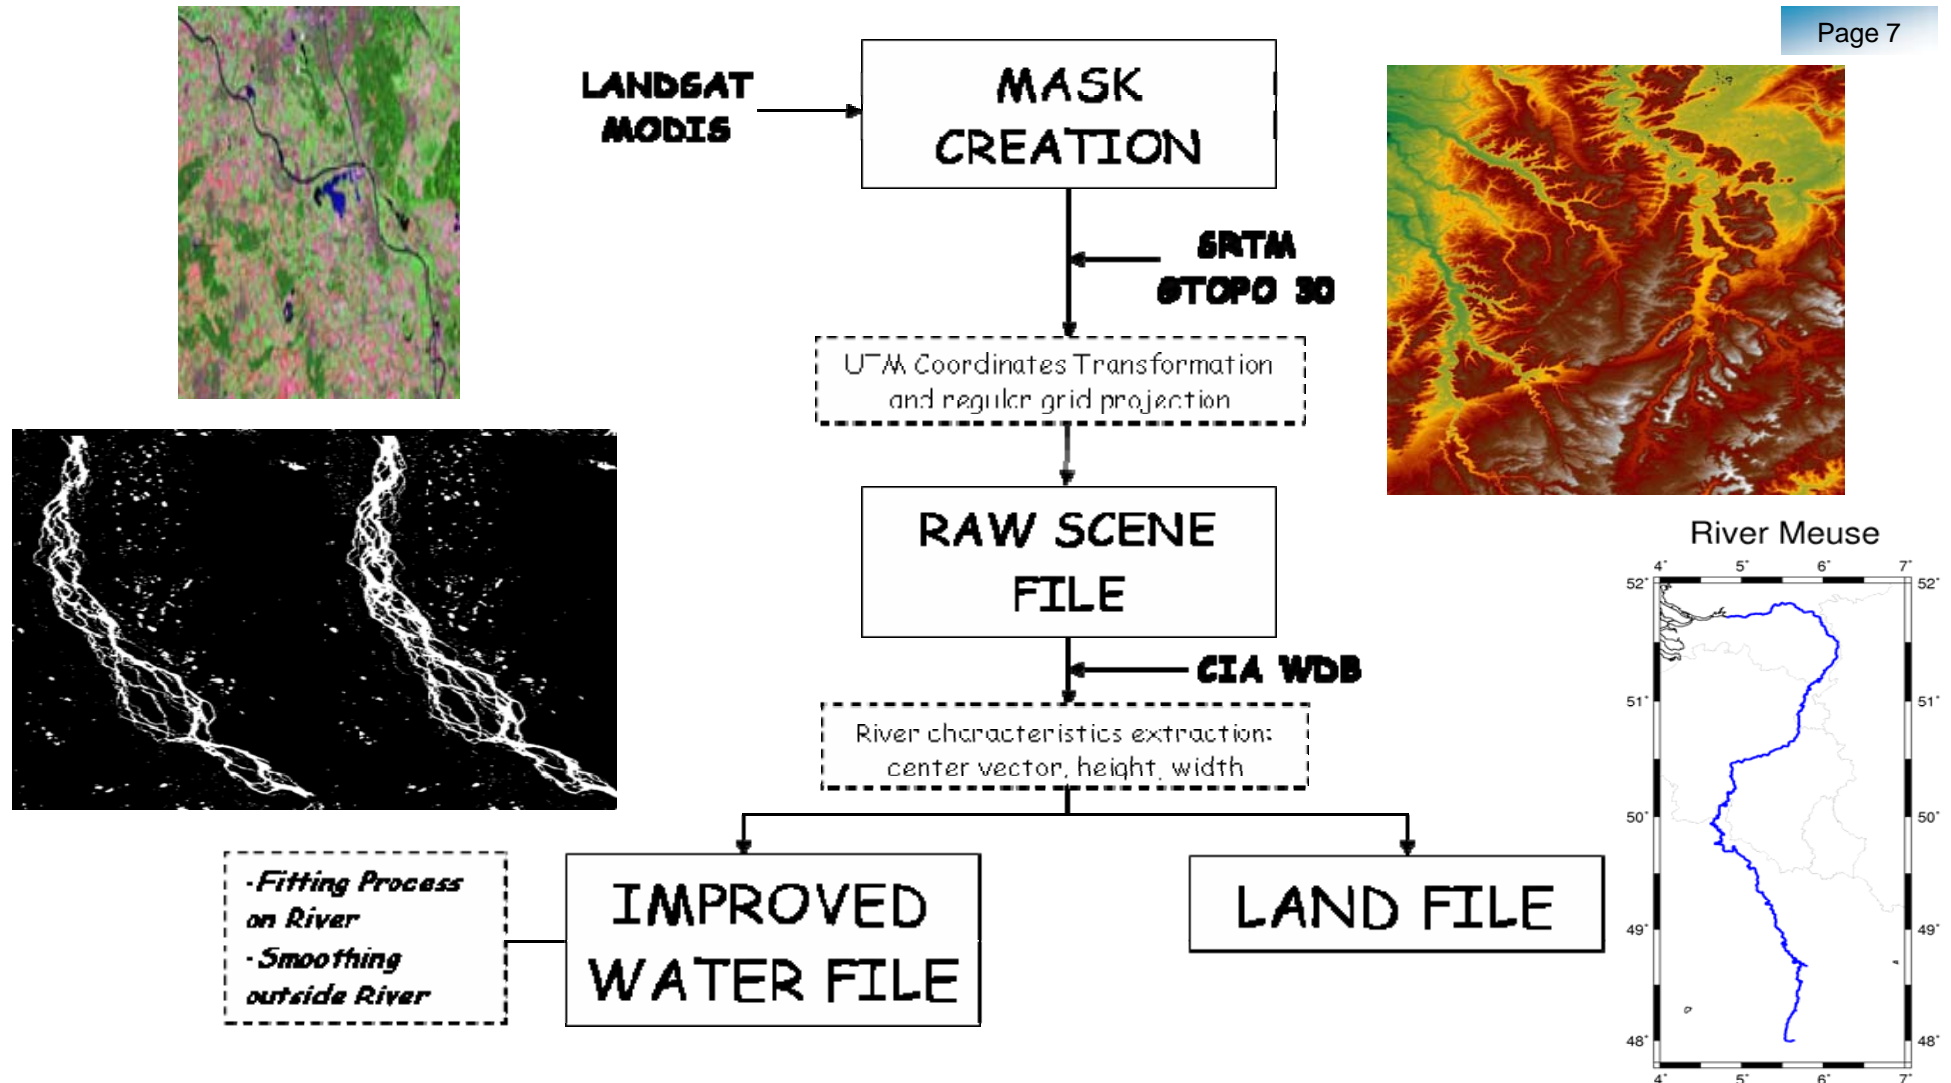

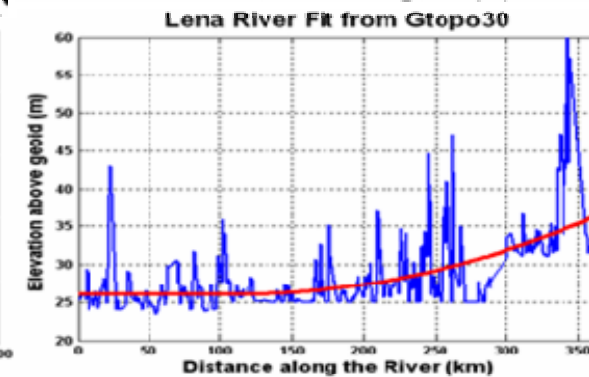

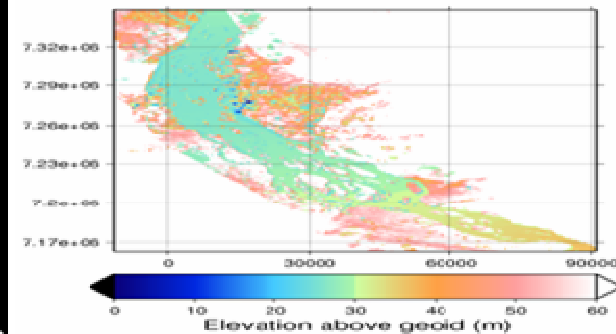

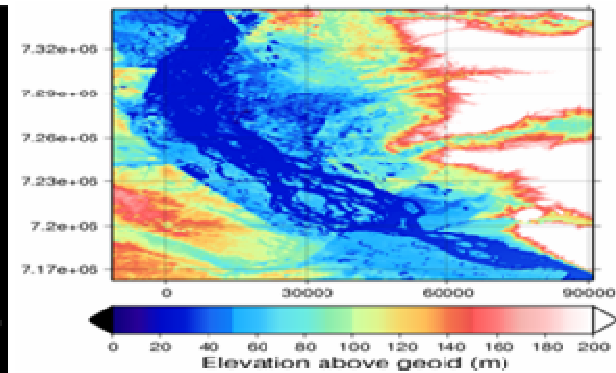

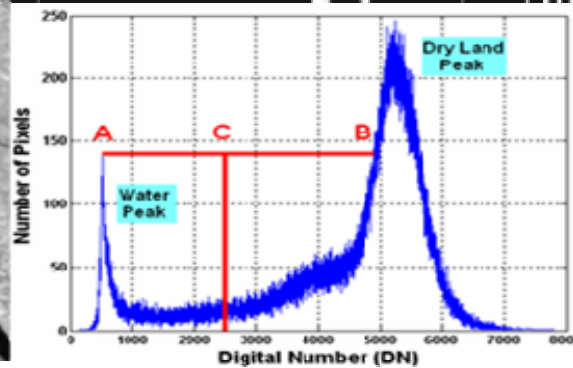

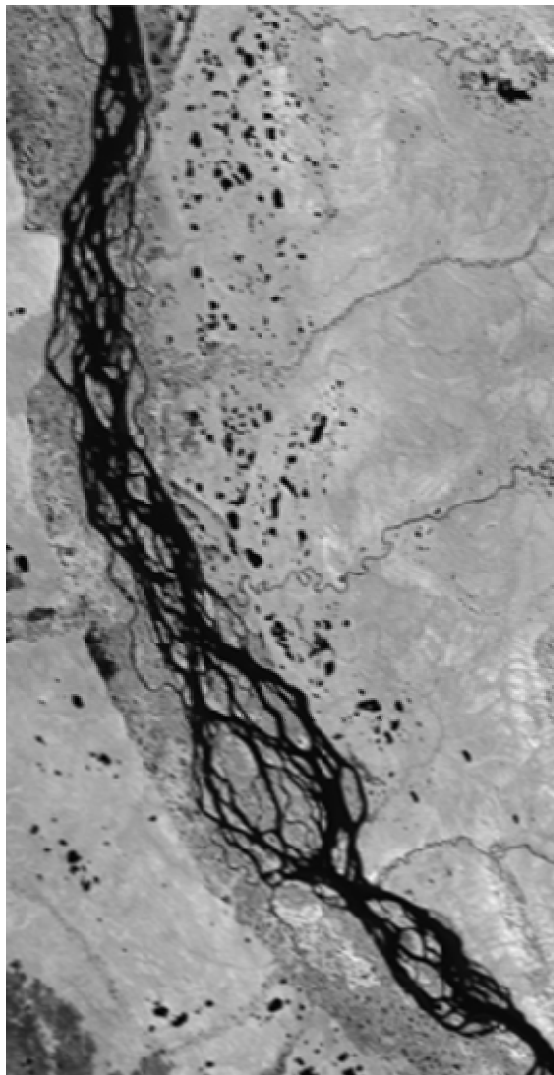

Empirical model : use the maximum information available

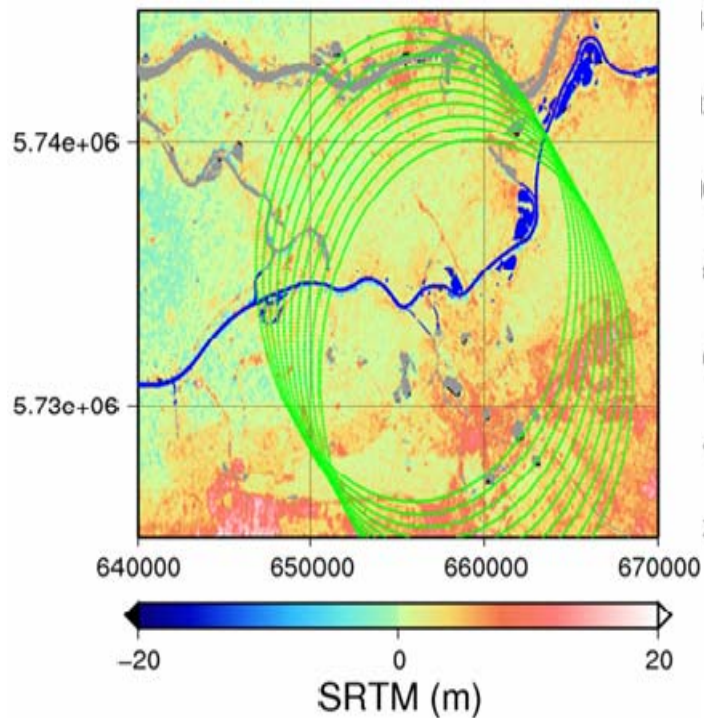

- **Numerical model relying on ancillary data** (DEM, masks)
- Target area parametrization:
 - Height and slope
 - Type of surface (backscattering coefficient)
- Simulation of radar waveforms histories over the area for different sets of parameters (**templates**)

Goal is to fit the empirical model to the data to estimate the right parameters

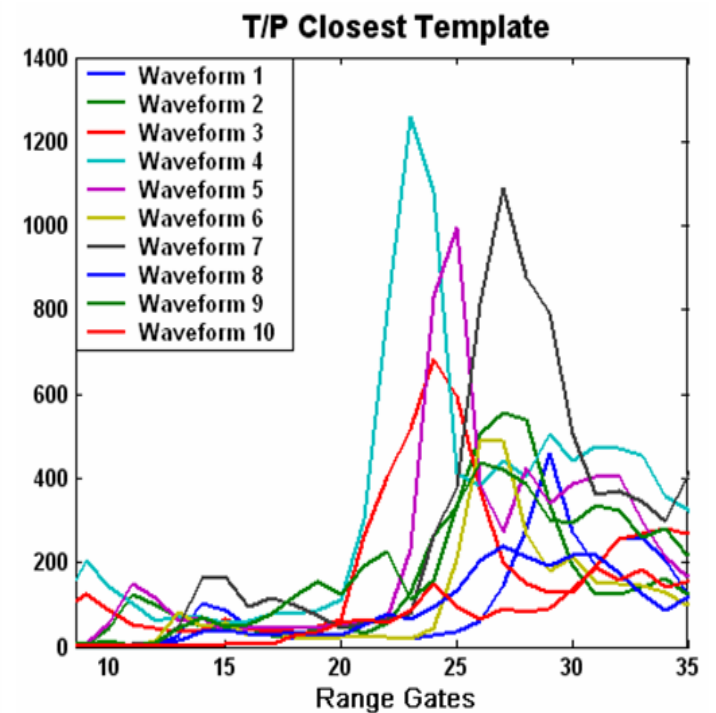

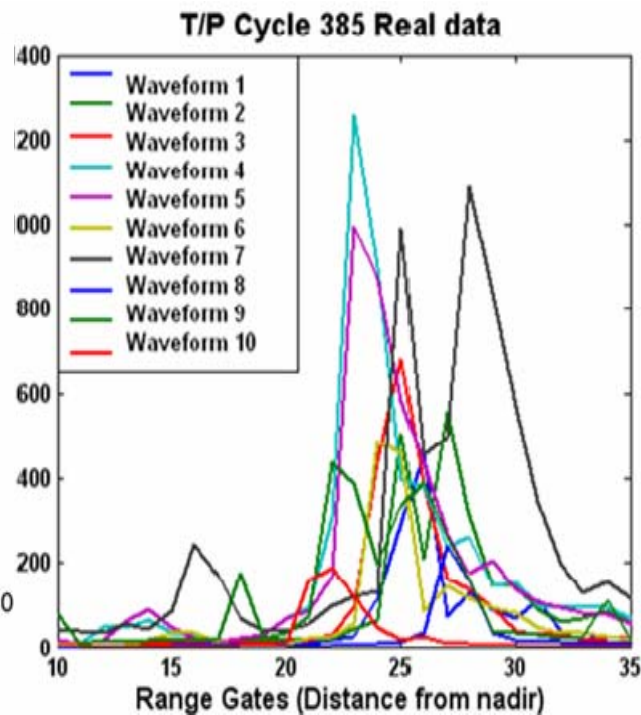

Height Estimation

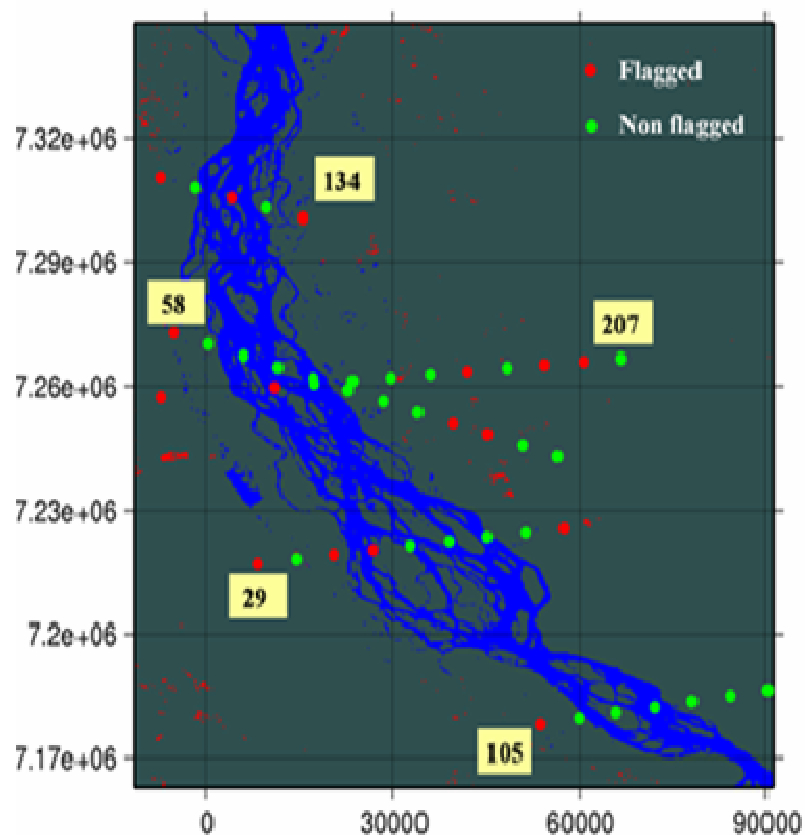

0.5 m

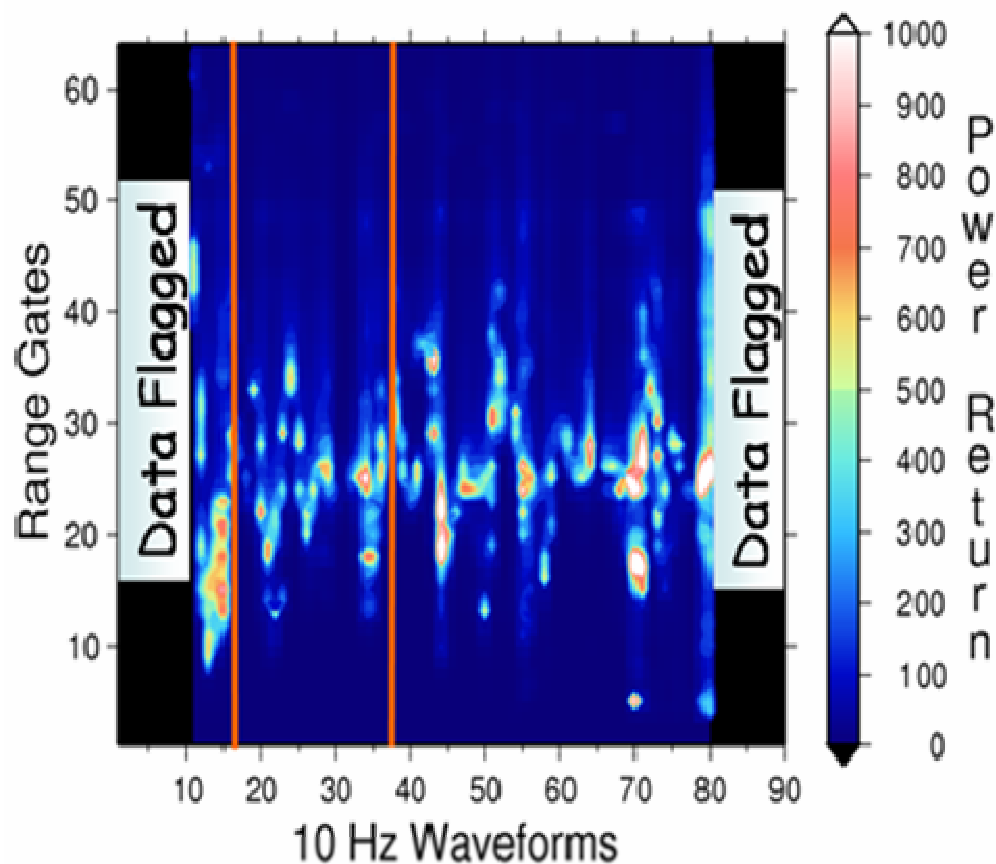

In Situ Data

0.45 m

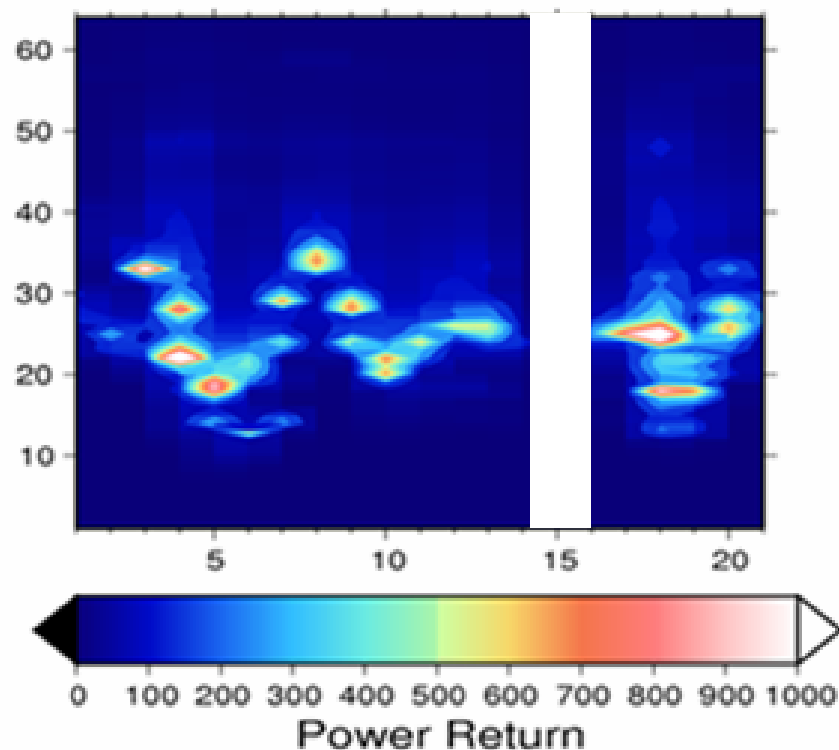

T/P on Lena cycle 430

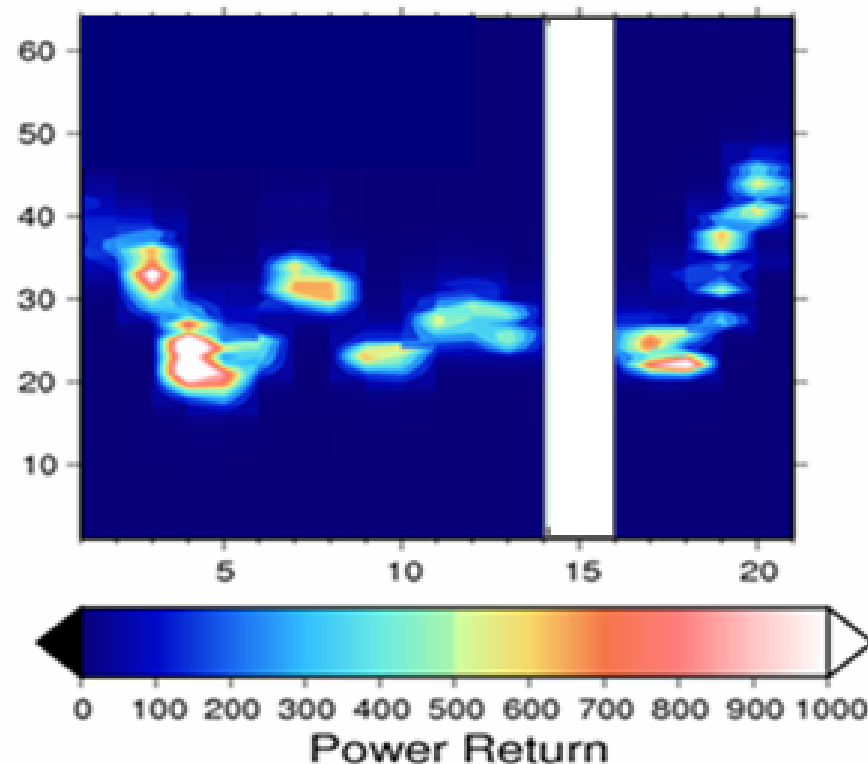

T/P Cycle 430 Pass 058

C430p058 Real Processed

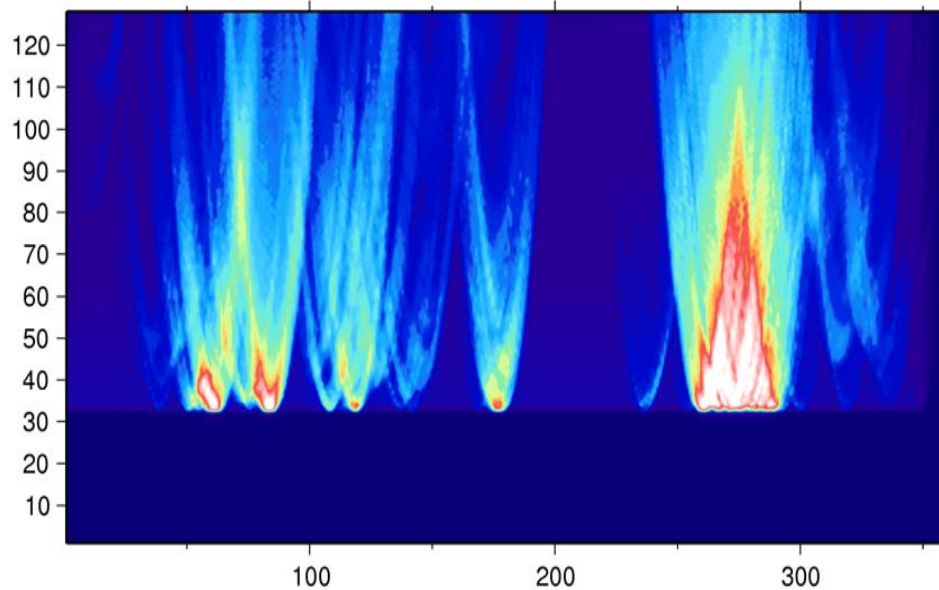

C430p058 Best Template 13.75 m

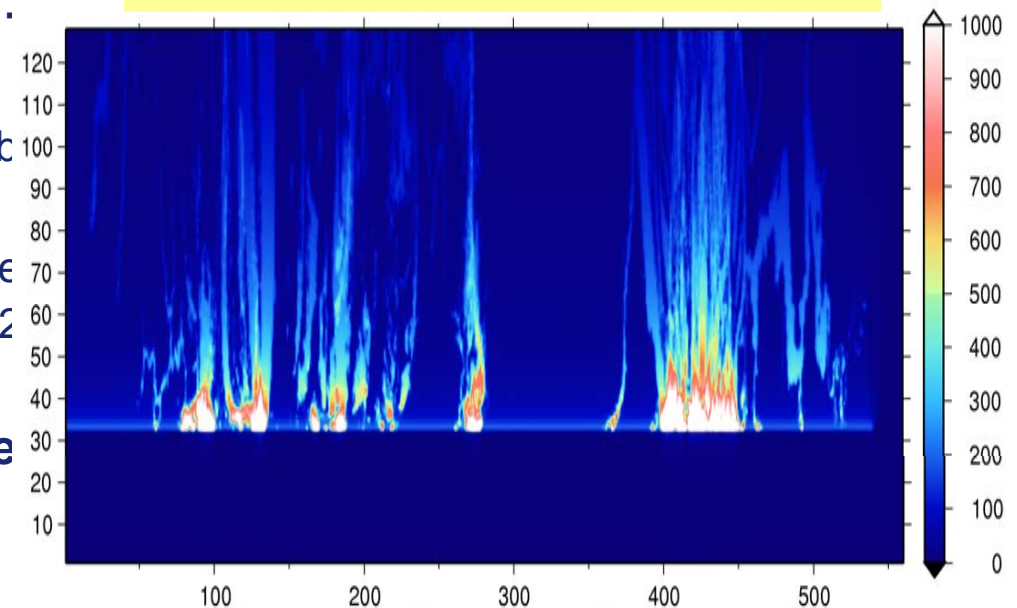

Very significant correlation between real data and template

Low Resolution Mode

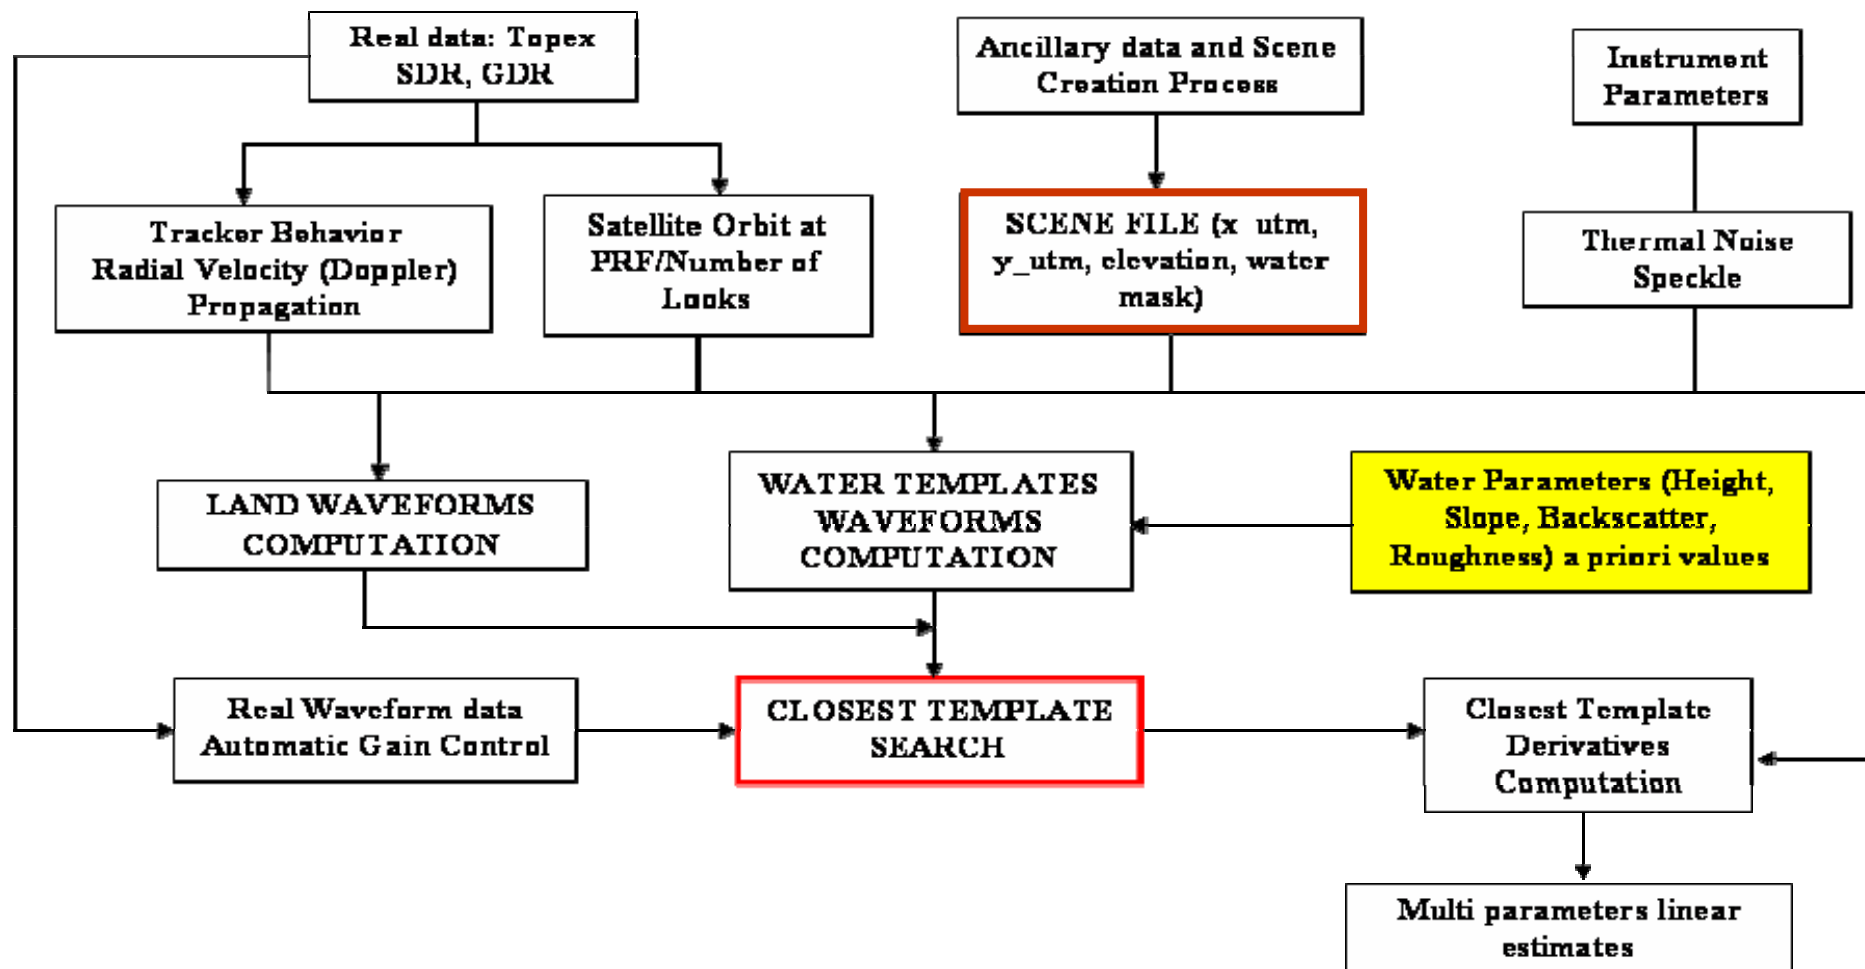

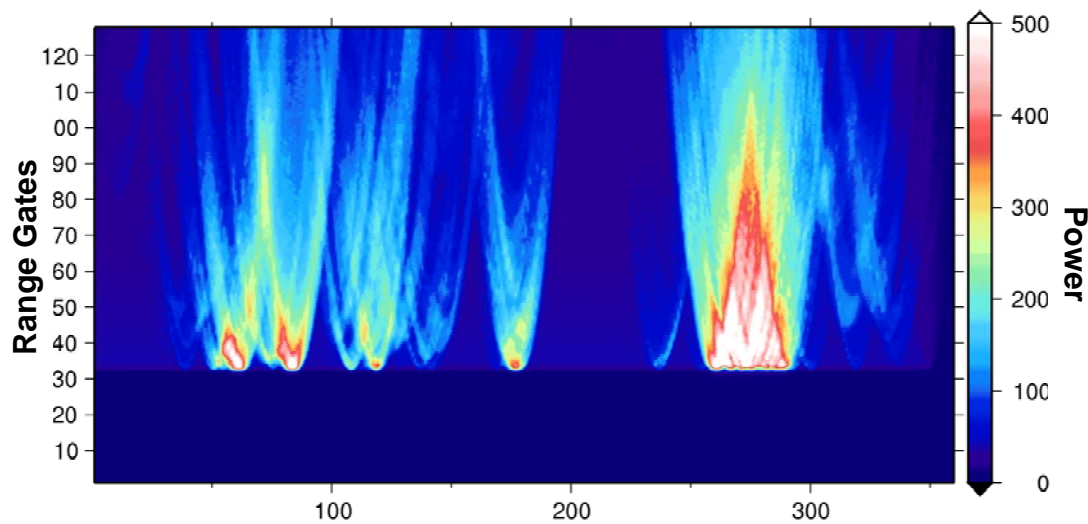

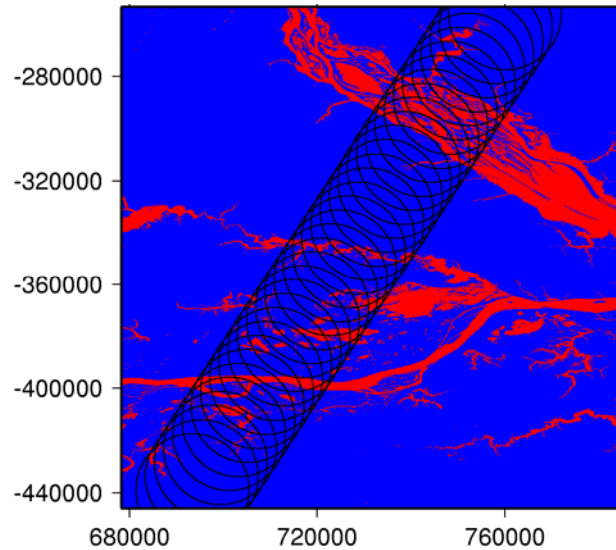

SAR Mode

Results have been published:

- Enjolras, V. Evaluation of the performances of interferometric imaging radar altimeters – application to oceanography and hydrology, PhD, January 2007.
- Enjolras, V. ; Rodriguez, E. Using Altimetry Waveform Data and Ancillary Information from SRTM, Landsat and MODIS to retrieve River Characteristics (submitted to IEEE TGRS)

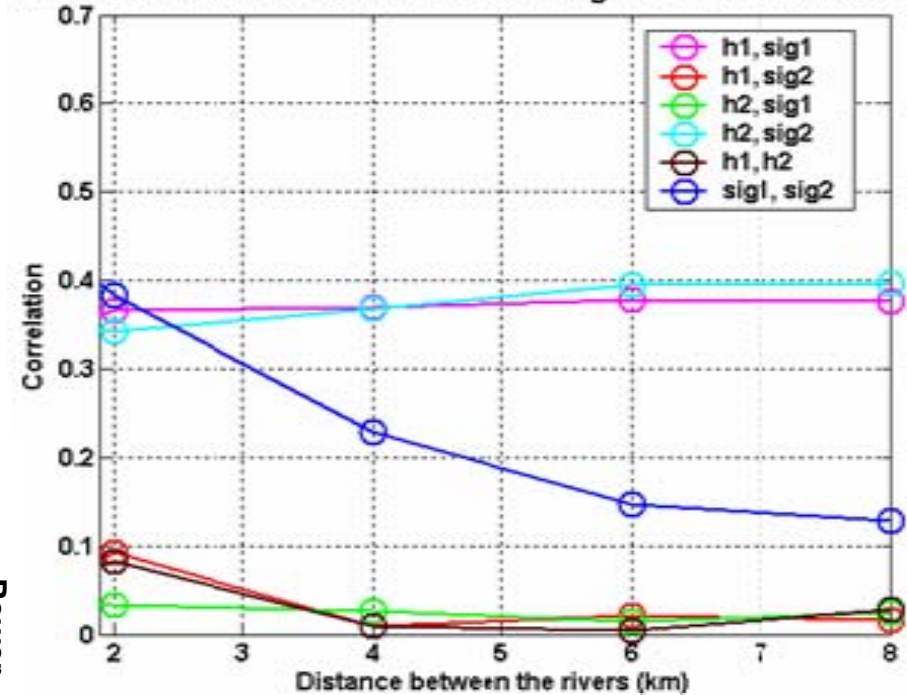

10 Hz waveforms

Business Unit Observation Systems & Radars

11/11/2007

Estimation of the correlation between height and radar cross section
