ESA Proba-V QWG #13
April 21-22, 2021

PV-CC: Proba-V Cubesat Companion

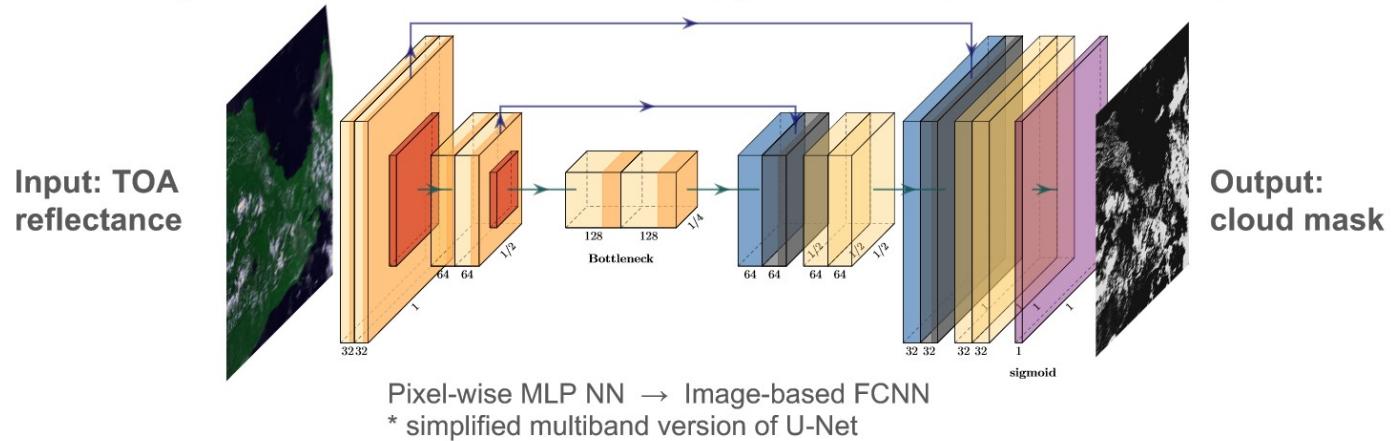

- PV-CC VNIR-SWIR camera identical to Proba-V
 - Launch Jan 2022 / March 2022? (no simultaneous acquisitions)
 - Ground Sampling Distance ~70m
 - Expected revisit of 13 days
- PV-CC Exploitation Plan
 - Re-use of PROBA-V ground segment
 - Cross calibration of PROBA-V and PV-CC (few months?)
- Exploitation opportunities using Deep Learning
 - 1 Transfer learning from Proba-V Cloud Mask to PV-CC
 - 2 Cross-sensor Domain Adaptation to assess the consistency of PV-CC products
 - 3 Fusion of PV-CC and Sentinel products: spatial and temporal sampling enhancement

1

Transfer learning from Proba-V CM to PV-CC

- Re-use of PROBA-V ground segment (Collection 2 CM based on MLP NN)
- Transfer learning: Models trained on Proba-V data could be directly used
- Fully Convolutional Neural Networks (spectral and spatial information)

2

Domain adaptation across similar sensors

- Domain Adaptation from PV-CC to Proba-V
 - Cross calibration of PROBA-V and PV-CC (no close in time images)
 - Domain Adaptation between PV-CC and Sentinel-3 & Sentinel-2
 - Harmonization of datasets captured by different platforms
 - Validation of calibration for small satellites such as PV-CC
- Generative Adversarial Domain Adaptation using GANs
- Learned from unpaired images (no co-registered/simultaneous acquisitions)
 - Useful for any general purpose cross-sensor application
 - PROBA-V archive can be used as a proxy of PV-CC data

Domain adaptation across similar sensors

CycleGANs:

Both directions:

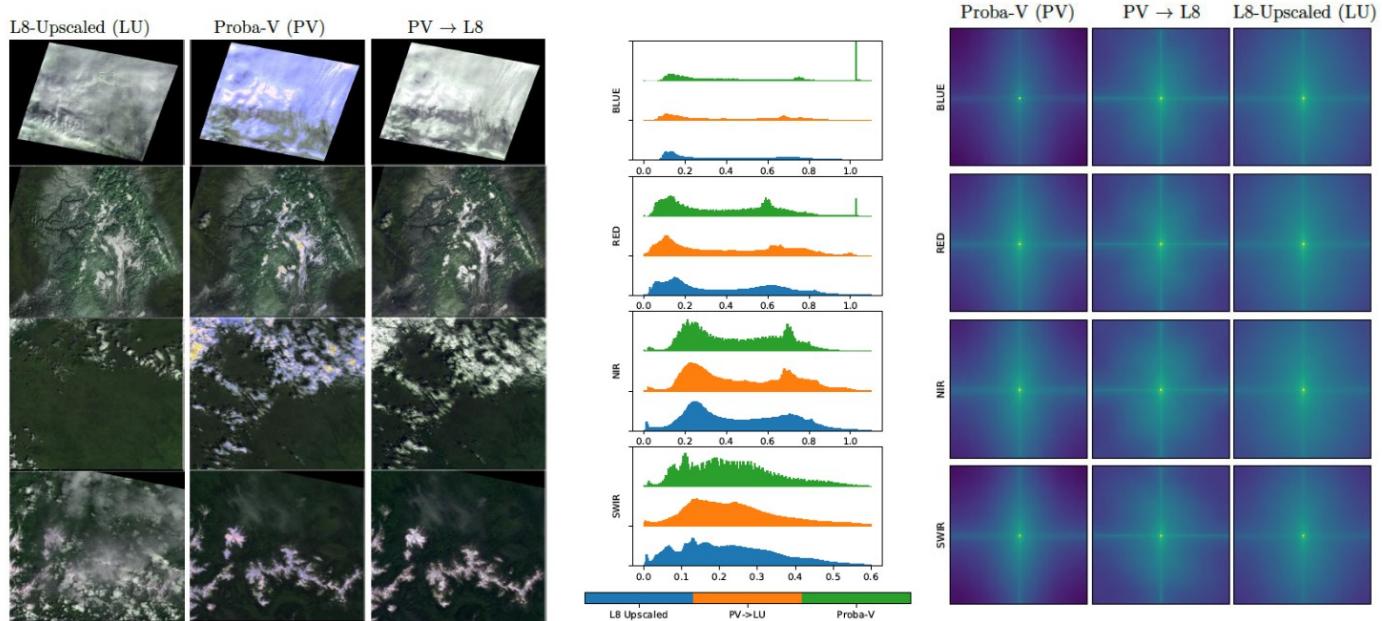

Application oriented:
e.g. cloud detection

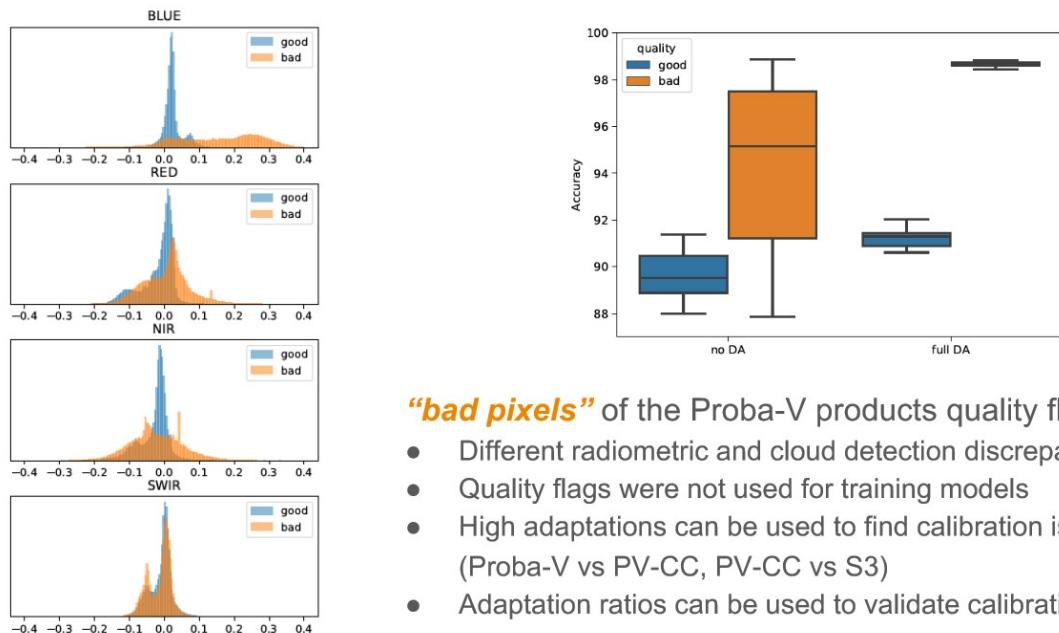

2

Domain adaptation across similar sensors

2

Domain adaptation across similar sensors

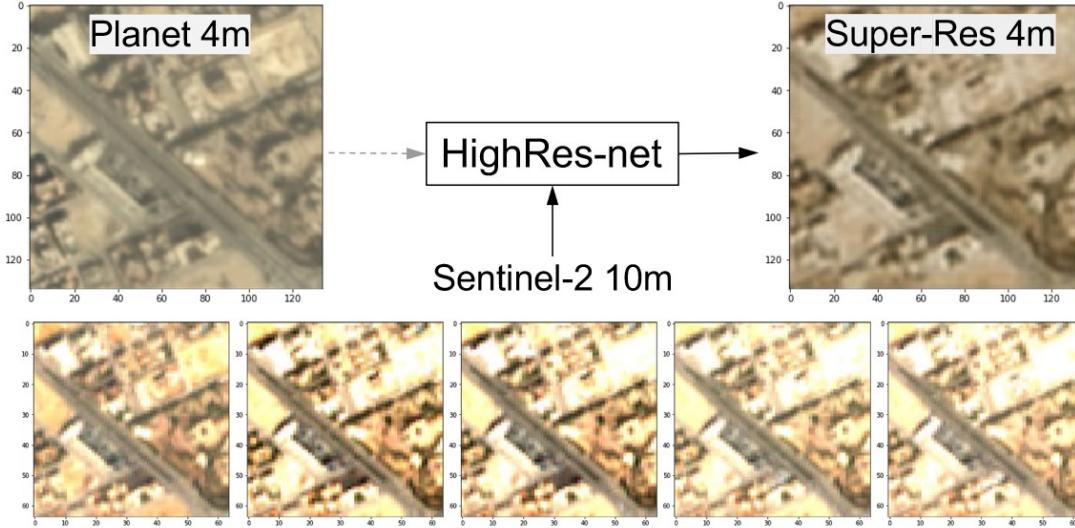

"bad pixels" of the Proba-V products quality flag:

- Different radiometric and cloud detection discrepancies
- Quality flags were not used for training models
- High adaptations can be used to find calibration issues (Proba-V vs PV-CC, PV-CC vs S3)
- Adaptation ratios can be used to validate calibration factors

3

Deep learning for fusion of PV-CC & Sentinels

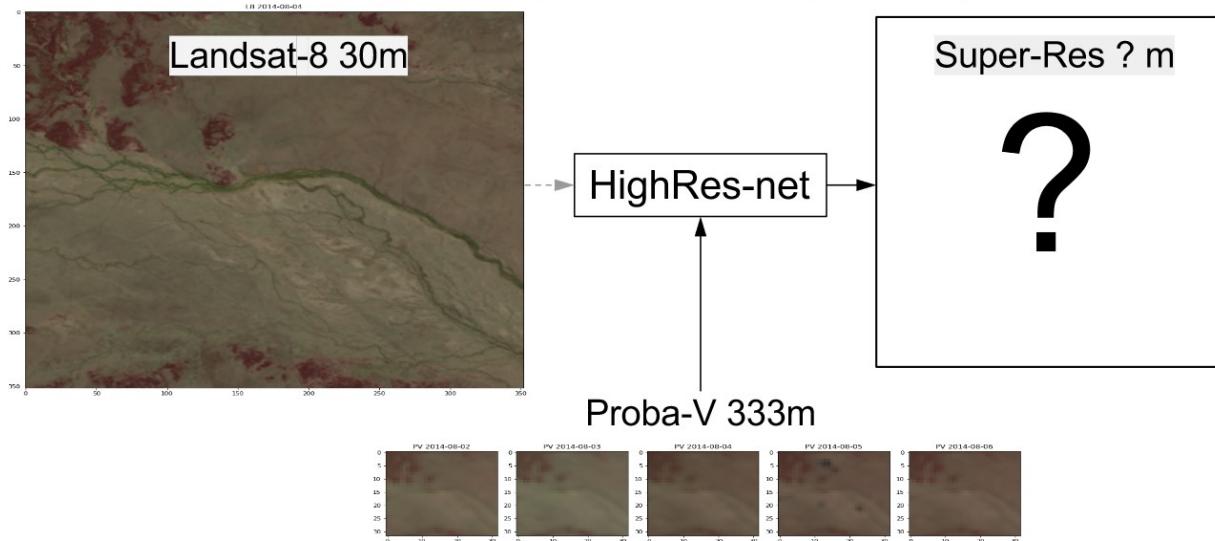

- Multispectral Multi-Frame Super-Resolution: spatial/temporal enhancement

3

Deep learning for fusion of Proba-V & Landsat-8

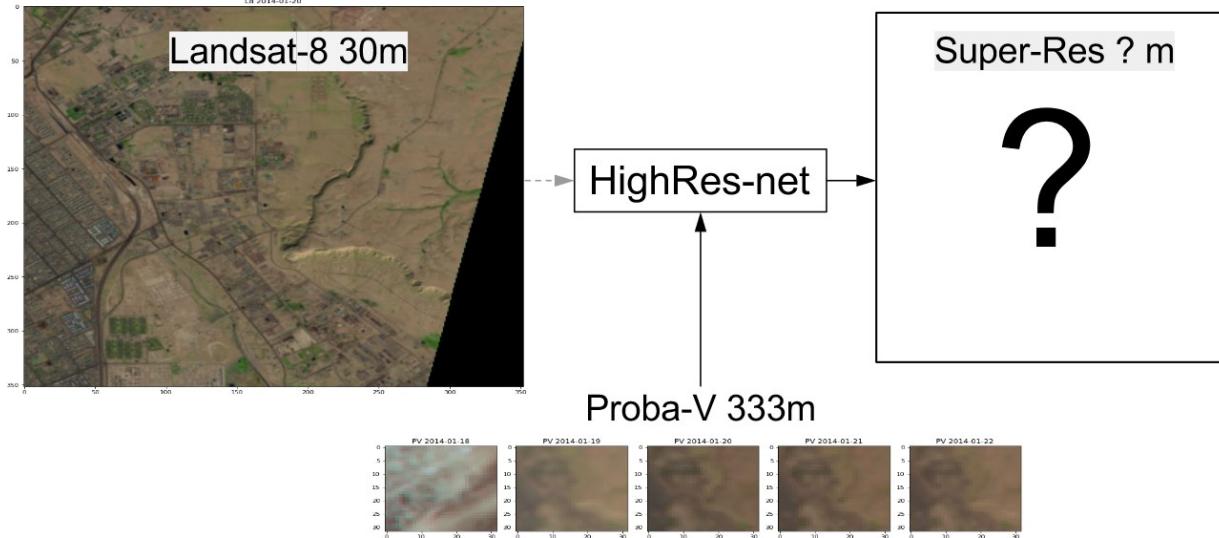

- Multispectral Multi-Frame Super-Resolution: spatial/temporal enhancement

3

Deep learning for fusion of Proba-V & Landsat-8

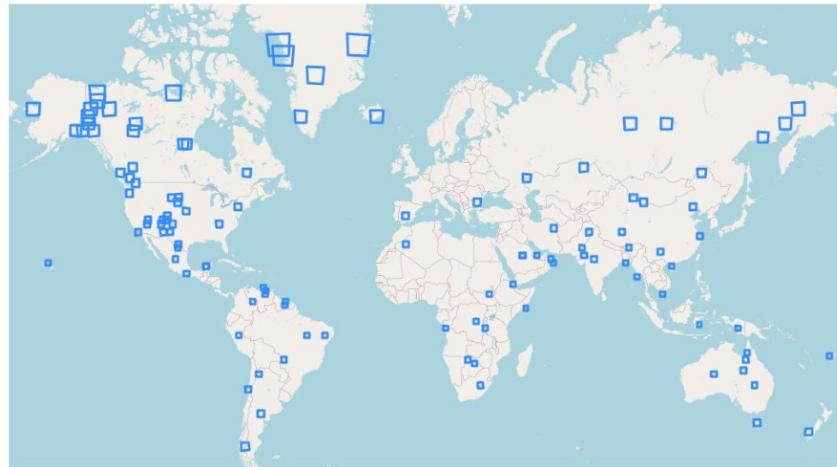

- Multispectral Multi-Frame Super-Resolution: spatial/temporal enhancement

3

Deep learning for fusion of Proba-V & Landsat-8

- Multispectral Multi-Frame Super-Resolution: spatial/temporal enhancement

Dataset: 65637 pairs of Landsat-8/Proba-V patches from 115 different locations

Summary: PV-CC Exploitation using Deep Learning

- 1 **Transfer learning** from Proba-V to PV-CC
 - o Exploiting spatio-spectral information with CNN
- 2 **Cross-sensor Domain Adaptation** to assess consistency
 - o Calibration: Linear/polynomial models (bias correction, calibration coefficients)
 - o Multiband nonlinear adaptation model:
 - Provides different adaptation depending on the radiance/surface
 - Analysis of discrepancies between original and adapted images \Rightarrow instrumental factors, radiometric calibration L1 TOA, atm. correction L2 TOC, geographical patterns, consistent time series
 - Consistency assessment between PV-CC and Sentinel-3
- 3 **Fusion of PV-CC and Sentinel** products (super-resolution)
 - o Spatial and temporal sampling enhancement & homogeneity in derived products
 - o PV-CC \Rightarrow Sentinel-2 or Sentinel-3 \Rightarrow PV-CC
